

(a) model

(b) protocols

(c) witness

reference:
 $\kappa_3[F(t)] = 0$
for every N_B

ramp, small t :
 $\kappa_3[F(t)] \neq 0$
for $N_B \geq N_0(t)$

$|\gamma_1|$ differs
 $\Rightarrow$ no shared
signed-affine
representation

Two arrows point from the "reference" and "ramp, small t" boxes to this text, indicating that the difference in the witness $|\gamma_1|$ between the two protocols implies the absence of a shared signed-affine representation.
